

Account Fields and Validation Rules

Synthetic account master-data knowledge base for the CertFlow RAG Assistant

Document Id	ACD-KB-004
Version	1.0
Effective Date	2026-04-01
Last Updated	2026-03-15
Owner	Master Data Governance Team
Status	active
Confidentiality	internal

1. Field classes

Master Fields define entity identity and are governed in MeridianMDM. Operational Fields support internal workflows and may be owned by HorizonCRM. Derived Fields are calculated from certified values and must not be manually overwritten unless the calculation is defective.

2. Core field catalog

Field	Class	Required	Primary validation rule
Account ID	Master	Yes	System-generated and unique
Legal Name	Master	Yes	Match legal registration or official filing
Display Name	Operational	Yes	Recognizable public or trading name
Primary Domain	Master	Yes	Normalized domain controlled by the entity
Website URL	Master	Yes	Reachable official website using HTTPS when available
Address Line 1	Master	Yes	Street and building information for headquarters
Address Line 2	Master	Conditional	Suite, unit, floor, or local secondary information
City	Master	Yes	Official locality name
Postal Code	Master	Conditional	Required where the country uses postal codes
State or Province	Master	Conditional	Required for countries with governed subdivisions
Country	Master	Yes	Approved country name and ISO alpha-2 code
Parent Account	Master	Conditional	Verified controlling or direct parent entity
Account Status	Operational	Yes	Active, Inactive, Acquired, Closed, or Unknown
Ownership Type	Master	Yes	Public, Private, Government, Nonprofit, or Unknown
Trading Symbol	Master	Conditional	Symbol only, without exchange name
Exchange Code	Master	Conditional	Approved exchange code stored separately
Industry	Master	Yes	Approved taxonomy category

3. Legal Name

Legal Name must represent the registered entity, including the legal suffix when supported by the governing source. Do not replace a legal name with a brand or product name. When an organization uses multiple registered entities, certify the entity that matches the account's country, contract, or operational purpose.

A legal-name change requires evidence of registration, official filing, merger, or reorganization. A website rebrand alone does not prove a legal-name change.

4. Display Name

Display Name is the recognizable name used in user interfaces. It may omit legal suffixes when that improves usability. It must not imply that a subsidiary is the parent company or combine unrelated organizations.

5. Website and Primary Domain

Store the canonical public website without tracking parameters or unnecessary paths. Primary Domain contains only the normalized host, for example atlas-example.com, without protocol, www, path, or query string.

Redirects are acceptable when they resolve to the same organization. A social profile, marketplace listing, email-provider domain, or reseller page cannot be the primary website.

6. Account Status

Use Active when the organization is operating and the entity can be verified. Use Acquired when the entity has been purchased but remains historically relevant. Use Closed only when a reliable source confirms cessation or dissolution. A broken website alone is insufficient to mark an account Closed.

7. Parent Account

Parent relationships must reflect verified ownership or control, not partnership, brand similarity, or distribution agreements. The direct parent is preferred over the ultimate parent unless the data model specifies otherwise. Evidence must identify both entities and the relationship.

8. Trading Symbol and Exchange Code

For public companies, store the trading symbol and exchange code in separate fields. Use the primary listing unless the certification request explicitly concerns another listed security. Do not include punctuation that belongs to the exchange display format unless it is part of the official symbol.

9. Unknown values

Use an approved Unknown value only when the field permits it and the analyst has completed the required research. Empty, N/A, -, TBD, and invented placeholder values are not interchangeable.
