

Request Types and Change Management

Synthetic account master-data knowledge base for the CertFlow RAG Assistant

Document Id	ACD-KB-007
Version	1.0
Effective Date	2026-04-01
Last Updated	2026-03-15
Owner	Data Operations Team
Status	active
Confidentiality	internal

1. Standard request types

Request type	Trigger	Typical scope
Scheduled Account Certification	Periodic quality review	Full record
Auto-Created Account Certification	New account created by integration	Identity, address, domain, duplicates
Stakeholder Change Request	Business user proposes a change	Named fields
Data Correction Request	Error identified in a system or report	Incorrect fields and downstream impact
Project or Initiative Review	Approved bulk activity	Defined population and fields
System Data-Quality Alert	Automated validation rule fails	Triggering fields plus identity check

The request type describes why work started. It does not determine whether the proposed change will be accepted.

2. Intake requirements

Each request must contain:

- Account ID and Account Name;
- source system;
- request type;
- requester and stakeholder team;
- project or initiative, when applicable;
- requested field or scope;
- proposed value, when applicable;
- source type and source link;
- business reason;
- requested completion date.

Missing information may be completed during triage when the entity is still identifiable. Otherwise, the request is returned to the requester.

3. Standardized change reasons

Use one primary reason for every changed field:

- Source-Based Validation;
- Account Certification;

- Auto-Created Account Certification;
- Stakeholder Request;
- Data Correction;
- Merger or Acquisition;
- Legal Entity Change;
- Address Relocation;
- Project or Initiative Update;
- System Synchronization Repair.

The change reason must describe the business cause, while comments explain the evidence and decision. Do not use vague reasons such as “updated,” “fixed,” or “requested.”

4. Required audit record

For every processed field, capture:

Audit attribute	Description
Account identification	Account ID, Account Name, and source system
Value change	Previous value and approved new value
Decision	Field outcome and verification status
Reason and comments	Standardized reason plus decision explanation
Evidence	Source level, exact source name, and reproducible link
Request context	Requester, request type, and project or initiative
Processing	Processor and processing date

5. Comments standard

A sufficient comment explains the original issue, research performed, source selected, difference found, final decision, and any follow-up. It should allow another trained analyst to understand the change without repeating the entire investigation.

Example:

> Updated Headquarters City from Northfield to Eastport. The official company contact page identifies Eastport as headquarters, and the approved professional-network profile shows the same address. Northfield is a former office location. Change reason: Address Relocation.

6. Bulk changes

Bulk changes require an approved field mapping, source definition, exception plan, sample validation, and row-level log. A successful upload does not prove that the data is certified.

Activity above 100 records requires QA sampling and Governance approval. Failed rows must be isolated unless they indicate a systemic mapping issue.

7. Rejected requests

When a proposed value is unsupported, retain the certified value, set the field outcome to Rejected, and explain the reason to the requester. Rejection of a proposed change does not mean the complete account record is rejected.
